Exercise 1: GitHub with AI

No marks

1. Sign in to **GitHub** in VS Code. Open a new empty project folder. Do not create a README file.
2. Ask AI: **"Create this project as a public GitHub repository. Link this folder to it. Do not create a README file."**
3. Create **hello.py** containing `print("hello")`. Create a local **.env** containing `EXAMPLE_ONLY=hello`. This is dummy data. Do not use real secrets.
4. Ask AI: **"Generate a .gitignore for this Python project. Include .env."** Open **.gitignore** yourself and check that it includes **.env**.
5. Ask AI: **"Check that .env is ignored. Commit and push only hello.py and .gitignore to GitHub. Do not commit or push .env or any other file."**
6. Open GitHub. Check that only **hello.py** and **.gitignore** are present. Check that **.env** still exists locally and is absent from GitHub.

Keep **.env** local. Push only **hello.py** and **.gitignore**.

Submit **exercise1.txt** containing only the public GitHub repository link. Save this answer file outside your practice project. No screenshots, ZIP or written explanations are required. Check Moodle for the deadline.
